PROJECT INTRODUCTION

Sebenza Clocking System is a proposed employee attendance and working-hours management system for Umzamo Analytical Services, a coal laboratory.

The project was identified from an existing attendance-management process in which employees manually record their clock-in and clock-out times and working hours using paper-based forms.

The current process relies on employees entering their own attendance information. According to the initial information provided by the stakeholder, there are situations where employees arrive late but record their normal expected starting time. There are also situations where overtime is recorded even though the employee did not work overtime.

This creates a need for a more reliable method of recording employee attendance and working hours.

The proposed Sebenza Clocking System will investigate and provide a digital method for recording employee clock-in and clock-out events using automatically generated timestamps. The system will also investigate an appropriate process for managing and verifying overtime.

The proposed solution will consist of a Flutter mobile application, an ASP.NET web application and a shared Supabase backend.

The project will be developed according to stakeholder requirements gathered from Umzamo Analytical Services.

PHASE 1: PLANNING, REQUIREMENTS AND FEASIBILITY

1. STAKEHOLDER AND PROBLEM ANALYSIS

1.1 ORGANISATION AND STAKEHOLDERS

Organisation: Umzamo Analytical Services.

Industry: Coal Mining Laboratory.

Primary Project Problem: Manual employee attendance and working-hour recording.

Proposed System: Sebenza Clocking System

Umzamo Analytical Services is the external stakeholder organisation for this project.

The organisation has been selected because its current employee attendance process is manually managed and relies on employees recording their own attendance and working-hour information on paper.

Stakeholder	Role
Employees	Record their attendance and working hours
Supervisors/Management	Monitor and verify employees' attendance and working hours
Human Resources	Manage attendance records
Finance	Use approved working-hours and overtime information

Project Team	Investigate, design, develop and test the proposed system

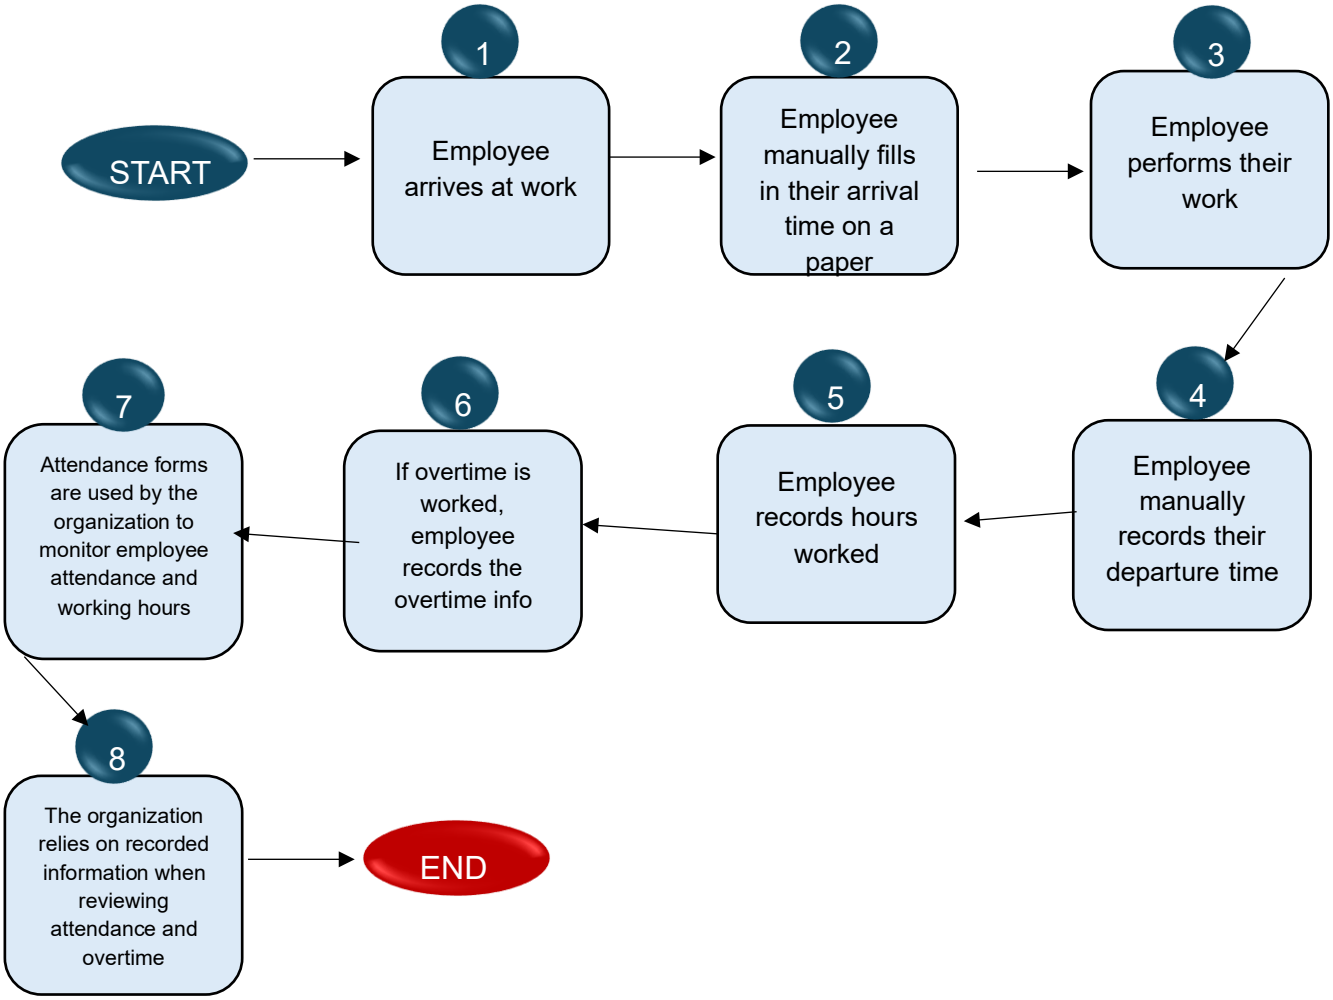

1.2 Current Process and People Involved

The current clocking in & out process is paper/manual based

The initial process is identified as follows:

1. Employee arrives at work
2. Employee manually fills in their arrival time on a paper attendance form
3. Employee performs their normal work
4. Employee manually records their departure time
5. Employee records hours worked
6. If overtime is worked, the employee records the overtime information
7. Attendance forms are used by the organisation to monitor employee attendance and working hours
8. The organisation relies on recorded information when reviewing attendance and overtime

1.2.1 Current Process diagram

1.3 Problem Statement and Affected Users:

Umzamo Analytical Services currently uses a manual paper-based process for recording employee attendance and working hours. Employees manually record their clock-in and clock-out times and may also record overtime.

The current process relies on self-reported information and does not automatically verify the actual time at which an employee arrives at or leaves the workplace. The stakeholder has identified instances where employees arrive late but record their normal starting time and instances where overtime is recorded even though overtime was not worked.

As a result, the organisation faces a risk of inaccurate attendance and working-hour records and may have trouble verifying the accuracy of recorded overtime.

A digital attendance management system is therefore required to investigate whether employee attendance can be recorded using automatically generated timestamps and whether overtime can be managed through a more controlled and verifiable process.

Effected Users;

- **Employees:** Employees are directly affected because they currently use paper forms to record their attendance and working hours.
- **Management:** Management may require attendance information to monitor employee attendance and working hours.
- **Payroll/Finance:** Payroll or finance personnel may use approved working-hour or overtime information if confirmed by the stakeholder.
- **Administration:** Administrative personnel may be responsible for managing employee attendance information.

1.4 Problem Experienced and its Consequence

The primary problem identified is that employees' attendance, working hours and overtime hours are manually recorded by employees

The Stakeholder has indicated that:

- Employees arrive late but record their normal starting time
- Employees take longer lunch breaks
- Employees may record overtime that was not actually worked
-
- The paper-based process does not automatically capture the actual hours worked and actual time at which an employee clocks in or out
- Attendance and overtime information therefore requires manual recording and verification

These consequences were confirmed by the organisation's stakeholders during the requirements investigation

Consequences of the Current problem:

- Inaccurate attendance records
- Difficulty verifying actual arrival time
- Difficulty verifying actual departure time
- Inaccurate working-hour information
- Incorrect overtime information
- Additional administrative work
- Difficulty maintaining reliable historical attendance records

1.5 Project Aim and Objectives

AIM:

The aim of the Sebenza Clocking System project is to develop an prototype digital employee attendance and working-hours management system for Umzamo Analytical Services that provides a more reliable and verifiable method of recording employee clock-in, clock-out and overtime information

OBJECTIVES:

- Investigate Umzamo Analytical Services existing attendance process o Identify problems associated with manual attendance recording o Identify the needs of employees, supervisors and management o Define a functional and non-functional system requirements o Design a realistic employee attendance management solution o Develop a Flutter mobile application for employee attendance function o Develop an ASP.NET application/API for backend and administrative functions
- Use Supabase as the shared database/backend o Automatically record clock-in and clock-out timestamps o Calculate working hours from recorded attendance data o Provide appropriate attendance reports
- Test the system against confirmed stakeholder requirements o Evaluate whether the proposed system addresses the identified problem

1.6 Project Scope

Employee Functions	Management Functions	Administration Functions	System Functions
o Employee clock-in	o View employee attendance	o Manage employee account	o Role based access
o Employee clock-out	o Search attendance records	o Manage attendance records	o Automatic timestamp generation
o Automated timestamp recording	o Filter attendance records	o Handle attendance corrections	o Working hours calculation
o View current attendance status	o Monitor attendance	o Generate attendance reports	o Attendance record storage
o View attendance history	o Review overtime		o Overtime management
o View recorded working hours	o Approve or reject overtime		o Audit information for changes

The project may be constrained by:

o Available semester time o Group members technical skills o

Stakeholder availability o Academic assessment deadlines

Project Assumptions:

- Stakeholders will provide information about the existing attendance process
- The organisation has a defined method of identifying employees o The group can obtain sufficient technical knowledge to use Flutter, ASP.NET and Supabase o The prototype will not process actual salary payments o The organisation will provide feedback on the proposed solution

Deliverables and acceptance criteria

Deliverable	**Acceptance criteria**
Flutter mobile application	Employees can successfully log in, clock in and clock out
ASP.NET backend	API successfully processes and validates attendance requests
Supabase	Attendance records stored correctly
Attendance management	Authorised users can view attendance history
Reports	Overtime can be recorded and managed according to approved rules

1.8 Requirements Prioritisation

Requirements	**Priority**
User authentication	Must have
Employee Clock-In	Must have
Automatic Clock- In timestamp	Must have
Employee Clock-Out	Must have

Automatic Clock-out timestamp	Must have
Attendance history	Must have
Working- hour calculations	Must have
Management attendance monitoring	Must have
Overtime management	Must have
Employee management	Must have
Break recording	Must have
Audit Logging	Should have

Attendance corrections	Should Have
Reporting	Must have

1.9 Stakeholder Needs

Employees	Management	Administration	Finance
Simple clock-in and clock-out process	Reliable Attendance information	Centralised attendance records	Accurate working-hour information for payroll use
Ability to view their attendance	Attendance reports	Reduced reliance on paper forms	
		Reliable attendance information	

1.10 Functional Requirements:

ID	Functional Requirements
FR1	The system must allow authorised users to securely log into the system.

FR2	The system must allow an authenticated employee to clock in.
FR3	The system must automatically record the date and time when the employee clocks in.
FR4	The system must allow an authenticated employee to clock out.
FR5	The system must automatically record the date and time when the employee clocks out.
FR6	The system must allow employees to view their recorded attendance history.

FR7	The system must calculate working hours using the recorded clock-in and clock-out timestamps, deducting approved break time where applicable.
FR8	Authorised supervisors and management users must be able to view employee attendance records.

FR9	The system must provide a mechanism for recording and managing overtime.
FR10	Authorised administrators must be able to manage employee information.
FR11	the system must allow employees to submit attendance correction requests.
FR12	The system must allow authorised users to generate and export attendance and overtime reports.
FR13	The system must record audit information for changes made to attendance, overtime, and employee records.
FR14	The system must allow employees to record break periods during their shift

1.11 Non- Functional Requirements

ID	Non-Functional Requirements
NFR1	The system should be simple and intuitive so that employees can clock in and out with minimal interaction
NFR2	The system should process normal clock-in and clock-out requests within an acceptable response time under normal operating conditions
NFR3	Only authorised users should be able to access employee attendance information
NFR4	Employee information and attendance records must be protected from unauthorised access
NFR5	The system should be reliable to store clock-in and clock-out information
NFR6	The system should be available all the time especially during working hours
NFR7	The system must maintain a tamper-evident audit trail of all changes made to attendance, overtime, and employee records

1.12 System Requirements

User Requirements	Software	Hardware
o Employee account	o Flutter mobile application	o Android smartphone /device for employees
o Management /admin account	o ASP.NET backend/API	o Computer for management and administration
o Appropriate authentication credentials	o Supabase database/backend	o Internet/network connection
	o Supported web browser for management functions	

1.13 Integration Requirements

The Sebenza Clocking System will integrate these three main technologies

1. **Flutter:** Flutter will be used to develop the employee mobile application/ system.

The application will communicate with the backend to, o Authenticate users o Submit clocking- in events o Submit clocking- out events o Retrieve attendance information o Display working hours and overtime hours

2. **ASP.NET:** ASP.NET will provide the server-side applications/ API. The asp.net component will, o Process requests from the Flutter application o Apply business rules o Validate attendance information o Manage authentications o Communicate with supabase
    - Provide necessary attendance and overtime information

3. **Supabase:** Supabase will provide the shared backend which will contain relevant information such as, o Users o Employees o Departments o Attendance o Overtime
    - Attendance corrections

1.14 Requirements change log

Version	**Requirement Changes**	**Reason**	**Date**
01	Initial Sebenza Clocking System concept	Identified manual attendance process	**18 August 2026**
02	Automatic clock-in timestamps added	Stakeholders identified inaccurate manual clock-in times	**22 August 2026**
03	Automatic clock-out timestamps added	Improved reliability of recorded clockout times	**22 August 2026**

04	Overtime approval process proposed	Stakeholders identified inaccurate overtime records	**29 August 2026**
05	attendance corrections, reporting, audit logging, break recording	Identified during Phase 2 design these features appear in the UI and ERD but were not formally specified in Phase 1	**25 September 2026**

1.15 Refined Project Scope

Following the initial stakeholder investigation, the refined project scope is centered on creating a digital attendance system that records employee clock-in and clock-out events using automatically generated timestamps

The project will not initially include payroll processing, biometric hardware, facial recognition or external payroll integration.

The core system will include:

- Clock-in o Clock-out o Automatic timestamps o Attendance history o Working hours calculations o Attendance monitoring o Overtime management o Attendance
- Basic reporting

1.16 Feasibility Study

Technical Feasibility Area: The proposed system/ application will use

Flutter, ASP.NET and Supabase. Potential technical challenges include, o API development o Database design

- Flutter and ASP.NET communication o Supabase configuration
- Role-based access control

Operational Feasibility Area: This proposed system/ application will improve the reliability of attendance records by automatically recording clocking- in and clocking- out time. However, this feasibility will depend on, o The willingness of the employee to use the system o Management acceptance

- Workplace connectivity

Economic Feasibility Area: The proposed system doesn't require any physical clocking hardware. Meanwhile potential costs may be, o Internet connectivity o Devices for developing the system o Future production deployment

Schedule Feasibility Area: The system must be developed within the semester. Therefore, the following core functions will be prioritized, o Clock- in o Clock-out o Attendance records o Working hours calculations o Overtime management o Reporting

Legal Feasibility Area: The system may process employee personal information and attendance information. Therefore, the system will consider the following,

- Privacy o Access control o Data protection o Secure storage

Ethical Feasibility Area: Attendance information will affect employees so the system should, o Record information accurately o Preventing unauthorized modification o Provide an appropriate o Protect private employee information

Overall Feasibility Decision: The Sebenza Clocking System is considered feasible as an academic prototype. The project will prioritise it's core functionalities before considering additional features

1.17 Project Risk Register

Risk ID	Risk Statement	Rating	Impact	Risk Level	Mitigation	Contingency	Risk Owner	Risk Status
Risk ID: 01	Stakeholder becomes unavailable	3-Possible	High	High	Schedule meetings early	Use remote communication	Stakeholder	Open
Risk ID: 02	Requirement change after development t begins	4-Likely	High	High	Confirm requirements early	Update requirements	Group members	Open
Risk ID: 03	Flutter and ASP.NET integration problems	4-Likely	High	High	Test API early	Simplify integration	Group members	Open

Risk ID: 04	Supabase problems	4-Likely	Medium	Medium	Develop supabase early	Rebuild affected components	Group members	Open
Risk ID: 05	System records incorrect attendance	3-Possible	High	High	Validate timestamps and logic	Provide authorised correction process	Group members	Mitigated
Risk ID: 06	Development exceeds available time	4-Likely	High	High	Monitor Microsoft Project plan and progress tracker	Prioritise core MVP	Group members	Open
Risk ID 07	Employee or management have a difficult time adapting to new digital system	possible	high	high	Keep the interface simple, provide basic user guidance, and demonstrate the system to stakeholders before evaluation	Provide additional guidance, simplify the interface where possible and collect user feedback.	Group members	open

Risk ID 08	Attendance records may be lost or become unavailable because of a database or backend failure.	possible	High	High	Use Supabase's database features appropriately, test data storage/retrieval, and maintain backups or recovery procedures where possible.	If attendance data becomes unavailable, investigate the database issue, restore available data from a backup/recovery point, and temporarily record attendance manually until the system is restored.	Group members	open

Three Identified as Highest Risk

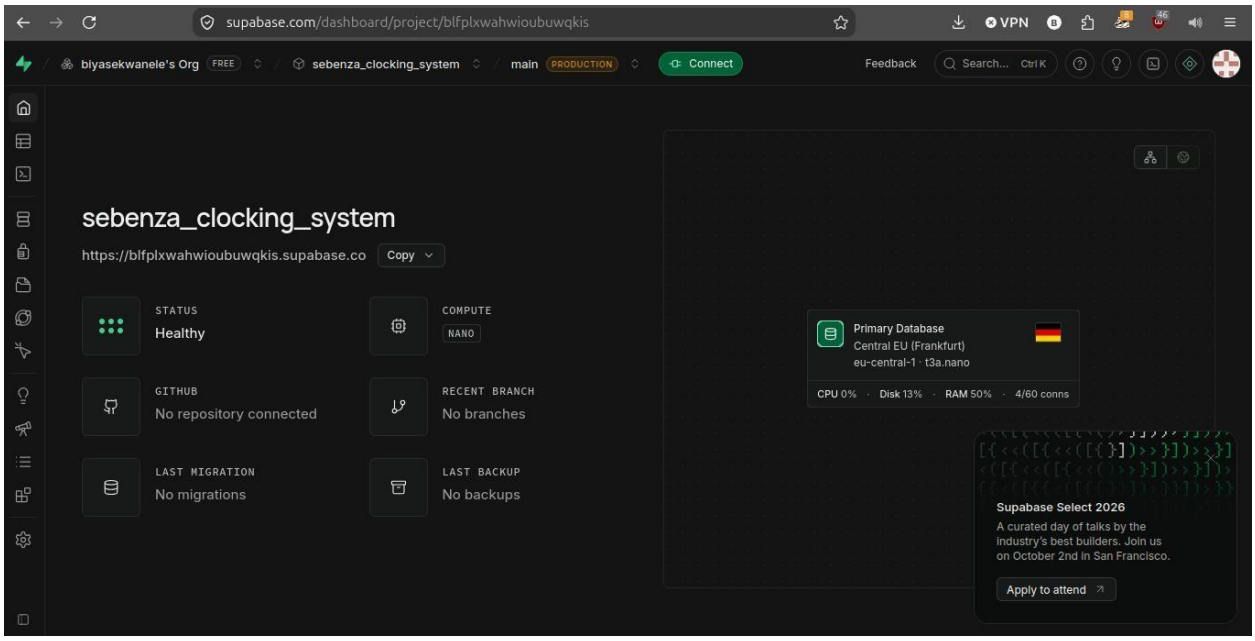

Excessive Project Scope: The project might become too large if the team attempts to implement advanced features like biometrics, facial recognition and complex analytics

Integration Problems: The system will require Flutter, ASP.NET and Supabase to communicate correctly

Unauthorised Access: Attendance information is potentially sensitive employee information

Supabase Screenshot

Supporting evidence

SEBENZA CLOCKING SYSTEM

Purpose of the interview

The purpose of this interview is to gather information from Umzamo Analytical Services about the current employee attendance and working hours process, the problems experienced with the existing manual paperbased system, and the requirements for the proposed Sebenza Clocking System.

STAKEHOLDER INTERVIEW QUESTIONS

1. How do employees currently record their clock-in and clock-out times?
2. How are attendance records stored and maintained?

3. What are the main problems you experience with the current paper-based attendance system?
4. Have there been situations where employees recorded an incorrect clock-in or clock-out time?
5. Should employees be able to view their attendance history?
6. Should the system automatically record the exact date and time when an employee clocks in and out?
7. How should the system calculate the total working hours from the clock-in and clock-out times?
8. What security measures should be used to protect employee attendance information?
9. Who should be authorised to access employee attendance records?
10. Would biometric or facial-recognition features be useful for the organisation in the future?

Figure 1 Interview Questions

Requirements Questionnaire Response

Organisation: Umzamowonke Trading and Project t/a Umzamo Analytical Services (UAS)

Respondent: Wendy Pako

Position: Human Resources (HR) Representative

Date: 31 August 2026

The following responses were provided by Wendy Pako, the HR representative of Umzamowonke Trading and Projects t/a Umzamo Analytical Services. The responses describe the organisation's current employee attendance process and the requirements for the proposed attendance management system.

Answers

1. **How do employees currently record their clock-in and clock-out times?**
   Employees manually record their clock-in and clock-out times in a timesheet register. After recording their times, they sign the register to confirm and authorise the information.
2. **How are attendance records stored and maintained?**
   Attendance records are stored in physical timesheet registers. The registers are kept and maintained by the company, with employees signing their entries to confirm that the information is correct.
3. **What are the main problems you experience with the current paper-based attendance system?**
   The current system is time-consuming and requires manual recording and calculations. Timesheet registers can also be lost, damaged, or difficult to search. There may also be problems with unclear handwriting, missing entries, and incorrect calculations.
4. **Have there been situations where employees recorded an incorrect clock-in or clock-out time?**
   Yes. Employees may sometimes record an incorrect time or forget to record their clock-in or clock-out time. Since the system is manual, these mistakes can occur and may require corrections and authorisation.
5. **Should employees be able to view their attendance history?**

Figure 2 Interview Answers

Yes. Employees should be able to view their attendance history to check their recorded working hours and ensure that their information is accurate.

6. **Should the system automatically record the exact date and time when an employee clocks in and out?**
   Yes. The system should automatically record the exact date and time when an employee clocks in and clocks out. This would reduce manual errors and provide more accurate attendance records.
7. **How should the system calculate the total working hours from the clock-in and clock-out times?**
   The system should automatically calculate the total working hours by subtracting the clock-in time from the clock-out time. Any approved break time should also be deducted where applicable.
8. **What security measures should be used to protect employee attendance information?**
   The system should use usernames and passwords and restrict access according to the user's role. Attendance information should be securely stored, and only authorised users should be allowed to view or modify records.
9. **Who should be authorised to access employee attendance records?**
   Employees should be able to view their own attendance records. Managers, supervisors, or authorised HR/administrative staff should have permission to access and manage employee attendance records. Changes to records should require proper authorisation.
10. **Would biometric or facial-recognition features be useful for the organisation in the future?**
    Yes. Biometric or facial-recognition features could be useful in the future because they could automatically identify employees and reduce the possibility of one employee signing in on behalf of another. However, the organisation would need to consider the cost, privacy, security, and employee consent before introducing these features.

PHASE 2

2. New chapter: System Architecture and Design

2.1 Introduction to System Design

The purpose of this chapter is to present the proposed system architecture and design for the Sebenza Clocking System. The design translates the requirements identified during Phase 1 into a structured technical solution that demonstrates how the proposed system will operate.

The system is intended to replace the organisation’s current manual attendance-recording process with a digital solution for recording employee clock-in and clock-out times, calculating working hours and managing overtime. The design consists of a Flutter mobile application for employees, an ASP.NET web application for authorised administrative and supervisory users, and Supabase as the shared backend platform.

The chapter presents the system architecture, UML diagrams, database design and user interface designs. These artefacts are intended to provide a consistent blueprint for the development and testing activities in the next phase.

2.2 System Architecture

2.2.1 Architecture overview

The Sebenza Clocking System will use a multi-component architecture comprising a mobile application, a web application, a backend/API and a shared database and authentication service.

Figure 2.1: Proposed system architecture for the Sebenza Clocking System

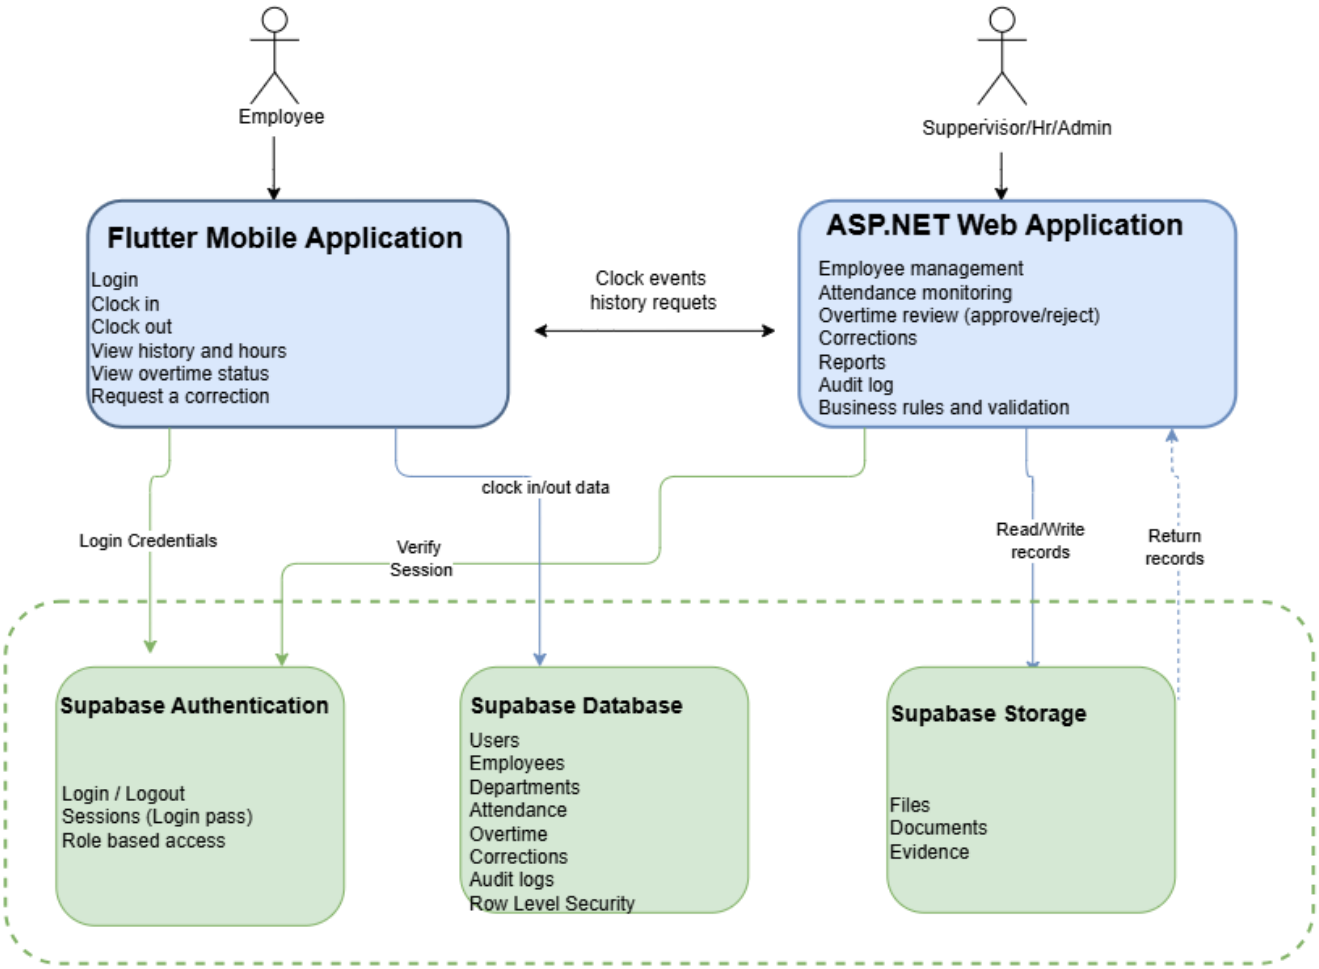

Figure 1 System Architecture

2.2.2 Architecture components and responsibilities

Components	**Responsibilities**
Flutter mobile application	Provides the employee interface for login, clocking in and out, view history and hours, view overtime status and requesting corrections.
ASP.NET web application	Provides the management interface for monitoring attendance and reviewing overtime requests, reports and audit logs.
Supabase Authentication	Supports role-based access and session management.
Supabase Database	Stores employee, attendance and overtime information, along with relevant audit information.
Supabase Storage	

The components are designed to work together rather than as separate standalone applications. Employees use mobile applications to submit attendance events. Authorised supervisors use the web application to view relevant records and process overtime decisions. The backend and database services support the shared data requirements of both interfaces.

2.2.3 How the components work together

When an employee opens the Flutter mobile application, the system first requires authentication. Once the employee is authenticated, the application can provide access to the functions permitted for that user.

When an employee selects the clock-in or clock-out action, the application sends the attendance request to the system’s backend. The backend validates the request and applies the appropriate attendance rules. The event is then stored in the shared database with a system-generated date and time. The application can subsequently retrieve the employee’s attendance information for display.

For management functions, an authorised supervisor uses the ASP.NET web application. The application checks the user's authenticated session and role before providing access to the overtime review functionality. It retrieves relevant pending overtime records and allows the supervisor to approve or reject a request, with a comment where required. The decision and associated audit information are then stored in the database.

The shared backend enables mobile and web applications to use consistent attendance and overtime information. Access to sensitive records must be restricted according to the user's role and the organisation's approved access rules.

2.2.4 Architecture design decisions

The proposed architecture uses Flutter for the mobile interface because the project requires an employee-facing application that can be used on supported mobile devices. ASP.NET is proposed for the server-side and management functions, while Supabase provides authentication and relational data storage.

The separation of responsibilities is intended to make the system easier to maintain and test. For example, the user interface is responsible for

displaying information and collecting user actions, while the backend is responsible for validating requests and enforcing business rules. The database provides persistent storage for the system's records.

The architecture remains a proposed design. During implementation, the group will need to confirm the exact communication method between Flutter, ASP.NET and Supabase, including how authentication tokens and database permissions will be handled.

2.2.5 The main data flow

1. **Employee → Flutter App:** Login details, clock in/out actions, overtime requests, correction requests
2. **Supervisor/HR/Admin → ASP.NET App:** Login details, overtime approvals/rejections, employee management actions.
3. **Flutter App ↔ Supabase Auth:** Login credentials sent, session token returned.
4. **Flutter App ↔ Supabase Database:** Clock in/out data sent, attendance history and working hours returned.
5. **ASP.NET App ↔ Supabase Auth:** Session and role verification.
6. **ASP.NET App ↔ Supabase Database:** Read/write requests for attendance, overtime, and employee records.
7. **ASP.NET App ↔ Supabase Storage:** Upload and retrieval of files and documents.
8. **Flutter App ↔ ASP.NET App:** Clock events and history requests exchanged to keep both interfaces consistent.

2.3.1 Use Case Diagram Overview

The Use Case Diagram presents the main interactions between the users of the Sebenza Clocking System and the system's functions. The diagram identifies the main user roles and the functions available to each role.

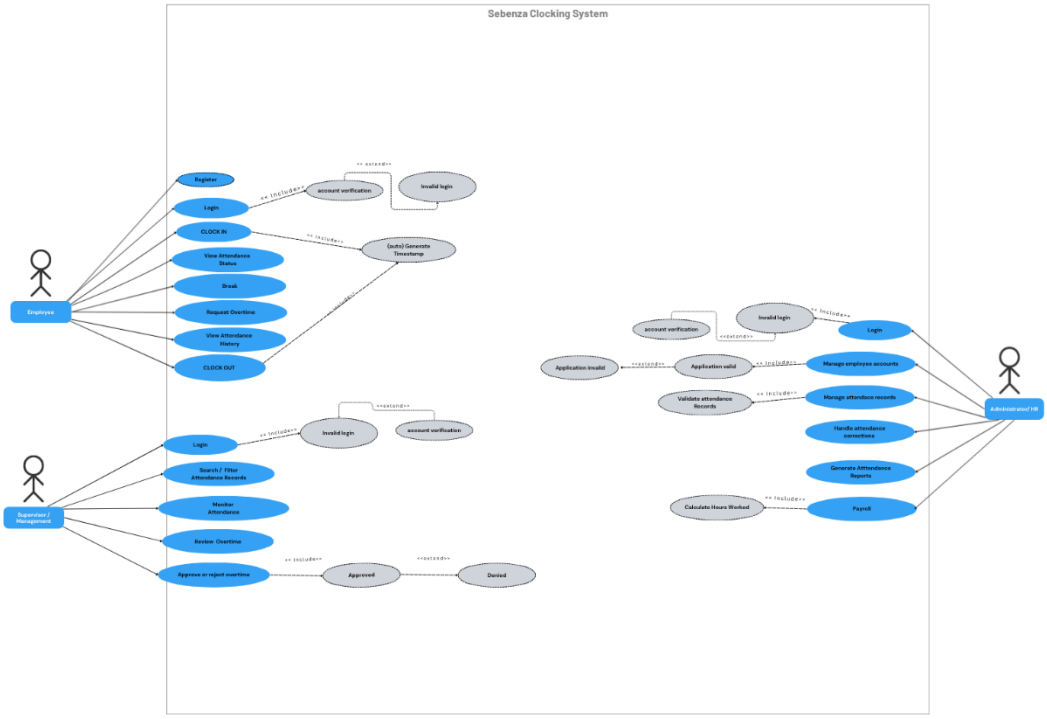

Figure 2 Use Case

Components

- Employee
- Supervisor/Management
- Administrator
- Sebenza Clocking System
- Use cases such as Login, Clock In, Clock Out, View Attendance History, View Working Hours, Monitor Attendance, Review Overtime, etc.

How the Components Work Together

Explain which actor performs which function and how <<include>> and <<extend>> relationships are used.

The Phase 2 brief specifically requires the system boundary, actors, use cases, associations and appropriate UML relationships.

2.4 Sequence Diagram — Employee Clock-In

2.4.1 Employee Clock In Overview

The Employee Clock-In Sequence Diagram illustrates the process followed when an employee clocks in using the Sebenza Clocking System. It shows the interaction between the employee, the Flutter mobile application and the backend services involved in processing and storing the clock-in information. The diagram demonstrates the sequence of requests and responses required to record an employee's attendance.

Figure 2.4: Employee Clock-In Sequence Diagram

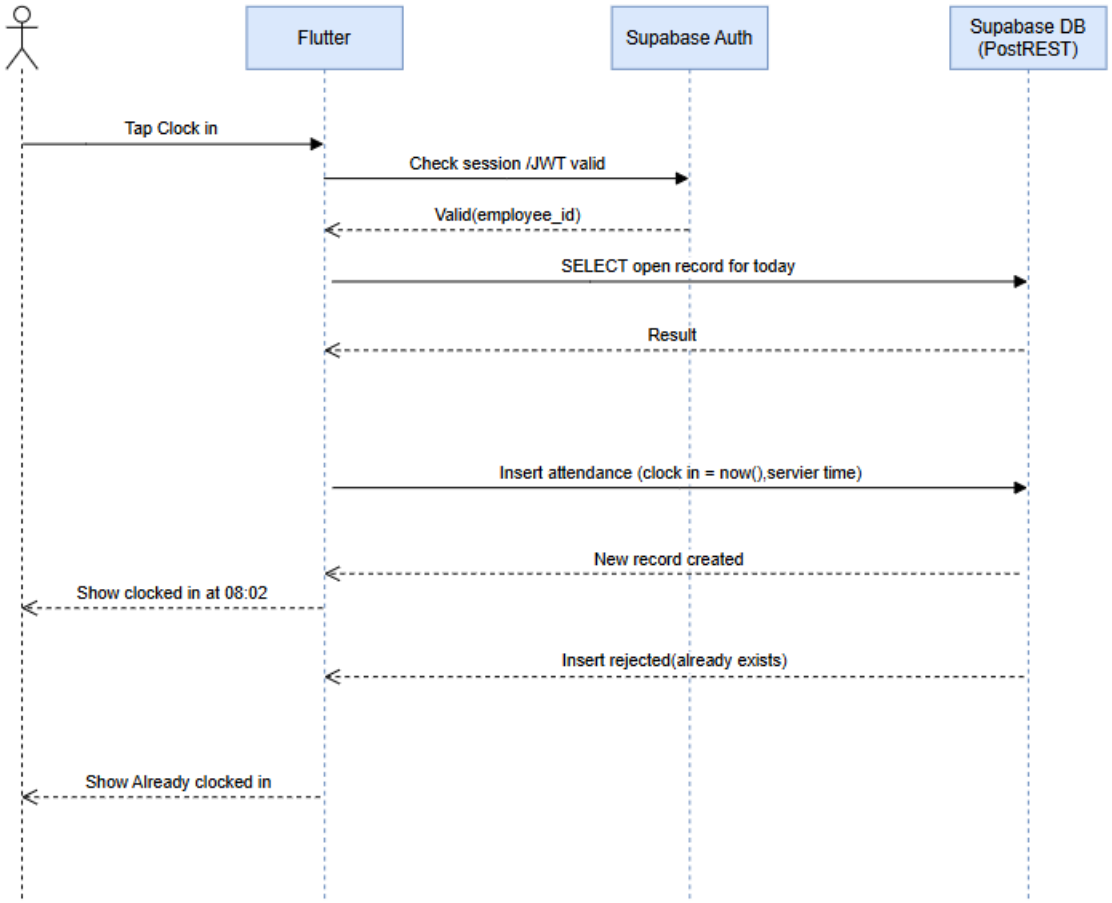

Figure 3 Clock n sequence diagram (flutter)

Explanation

The Employee Clock-In sequence diagram represents the process followed when an employee records their arrival.

The employee interacts with the Flutter mobile application to initiate the clock-in process. The application communicates with the relevant backend services to authenticate and process the request. The system records the clock-in event using an automatically generated timestamp and stores the attendance information in the shared backend.

2.5 Sequence Diagram — Overtime

2.5.1 Overtime Sequence Diagram — Overview

The Overtime Review Sequence Diagram illustrates the process followed when authorised management reviews an employee's overtime information. It shows how the management user interacts with the ASP.NET web application and how the application communicates with the backend database to retrieve and update overtime information.

Figure 2.5: Overtime Review Sequence Diagram

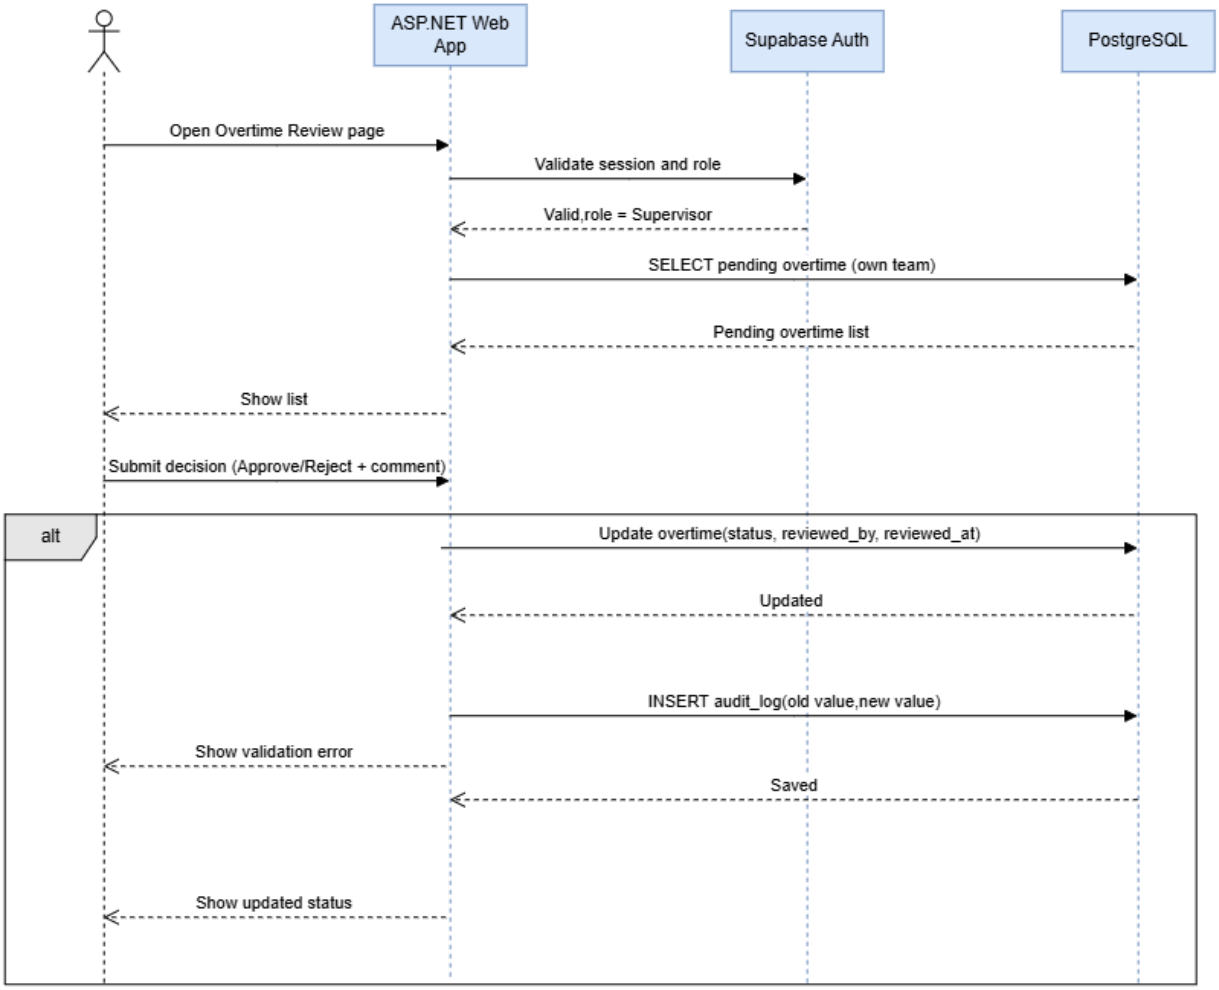

Figure 4 Overtime sequence diagram (ASP.NET)

Explanation

The Overtime Review sequence diagram represents the process followed by a supervisor when reviewing an employee's overtime record.

The supervisor accesses the overtime review function through the ASP.NET web application. The system validates the supervisor's session and role before retrieving pending overtime records.

3. DATABASE DESIGN: ENTITY RELATIONSHIP DIAGRAM (ERD)

3.1 ERD Overview

The Entity Relationship Diagram (ERD) shows how the Sebenza Clocking System organises its data in the Supabase database. The design is centered on the **Employees** table, which links to all other tables in the system. This structure ensures that every action in the system (clocking in, requesting overtime, correcting records) is tied to a known employee.

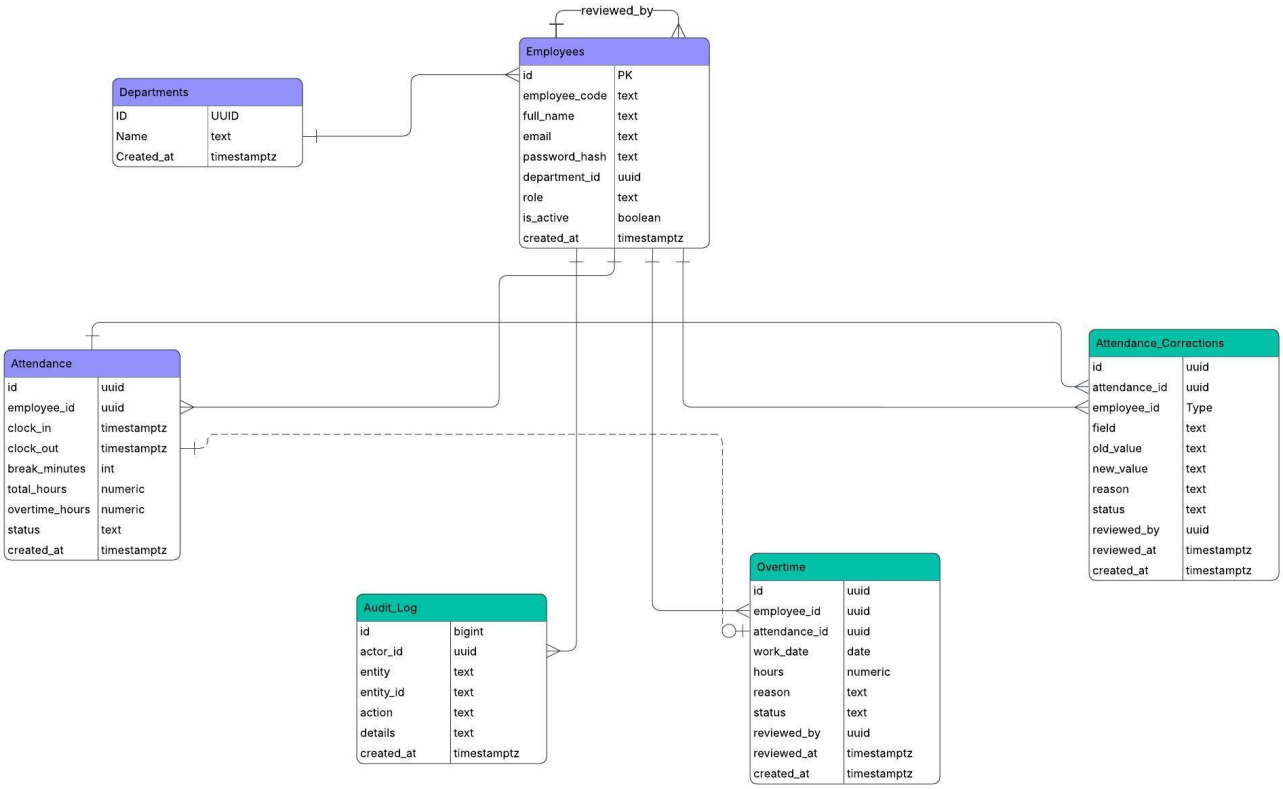

Figure 5 Entity Relationship Diagram

2.6.3 Entity and Attributes table

Entity	Key Attributes	Primary Key	Foreign key
Departments	D, Name, Created at	ID	-
Employees	id, employee_code, full_name, email, password_hash, department_id, role, is_active, created_at	Id	department_id → Departments.ID
Attendance	id, employee_id, clock_in, clock_out, break_minutes, total_hours, overtime_hours, status, created_at	id	employee_id → Employees.id
Overtime	id, employee_id, attendance_id, work_date, hours, reason, status, reviewed_by, reviewed_at, created_at	id	employee_id → Employees.id; attendance_id → Attendance.id; reviewed_by → Employees.id
Attendance Corrections	id, attendance_id, employee_id, field, old_value, new_value, reason, status, reviewed_by, reviewed_at, created_at	id	attendance_id → Attendance.id; employee_id → Employees.id; reviewed_by → Employees.id

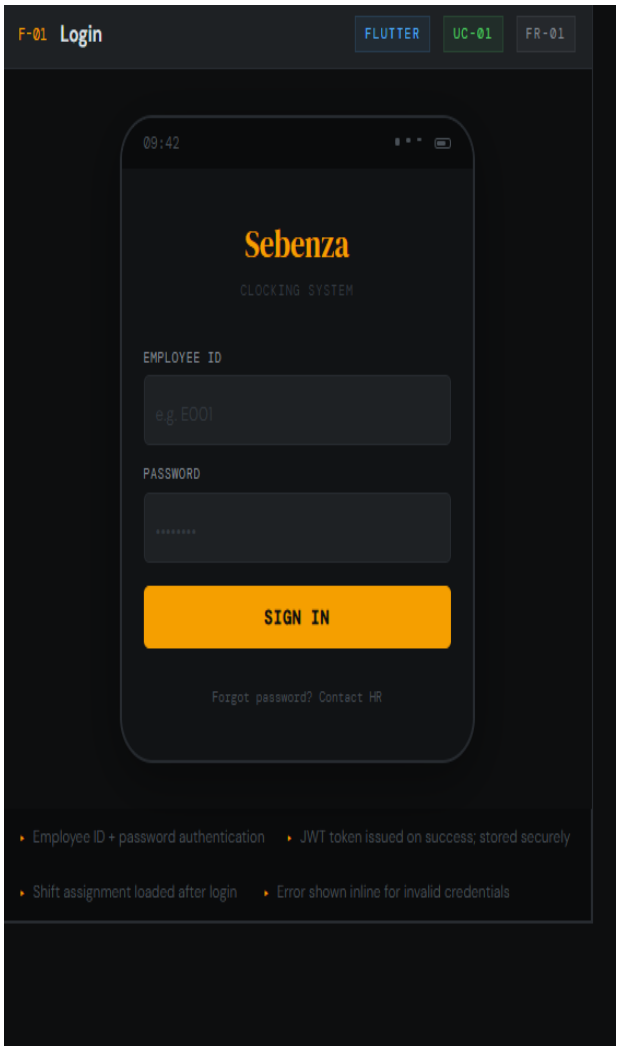

Audit Log	id, actor_id, entity, entity_id, action, details, created_at	id	actor_id → Employees.id

2.6.4 Relationship Table

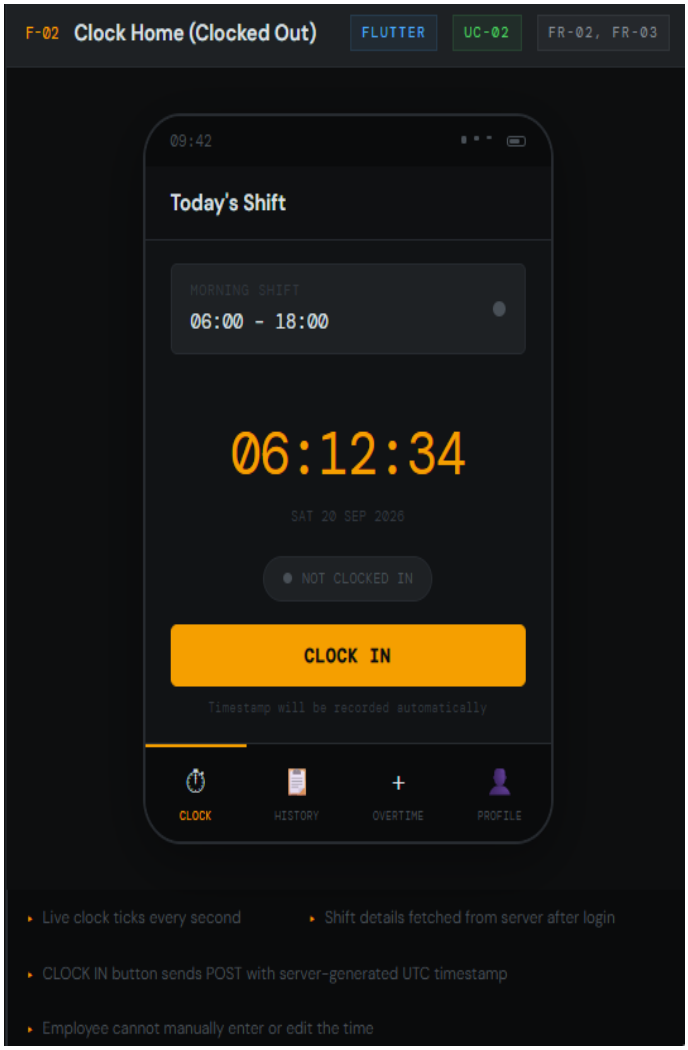

Relationship	Cardinality
Department To Employees	1:m
Employees to Attendance	
Employees to Overtime	
Attendance to Overtime	
Attendance to Attendance Corrections	

4. USER INTERFACE DESIGN AND DESIGN ALIGNMENT

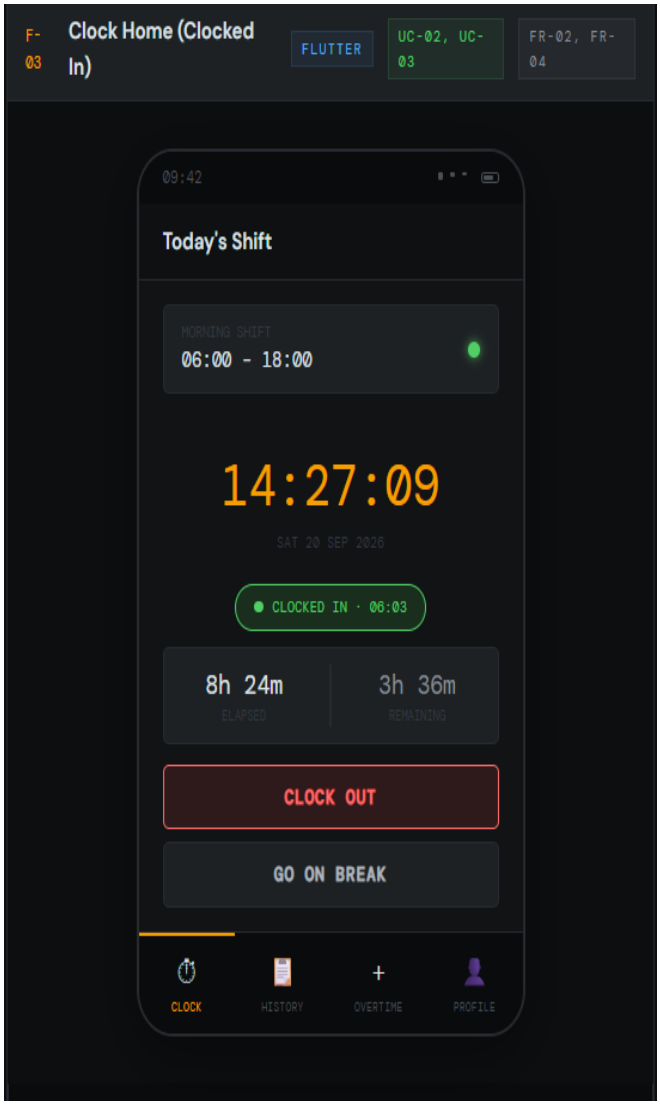

main Flutter mobile screens

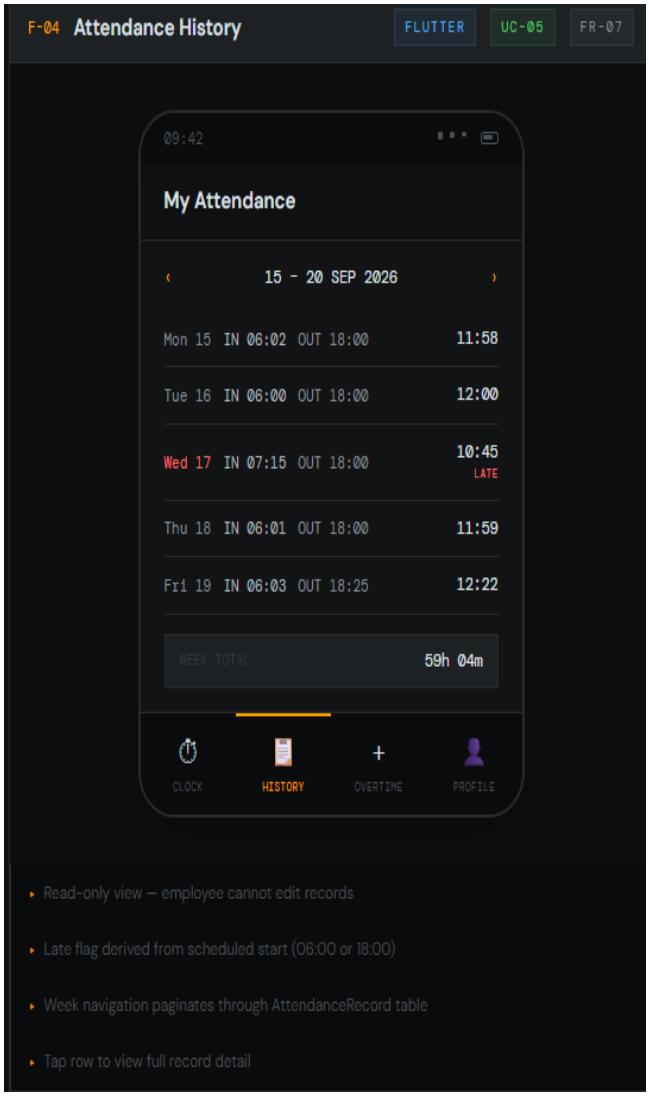

Employee enters credentials to access the system

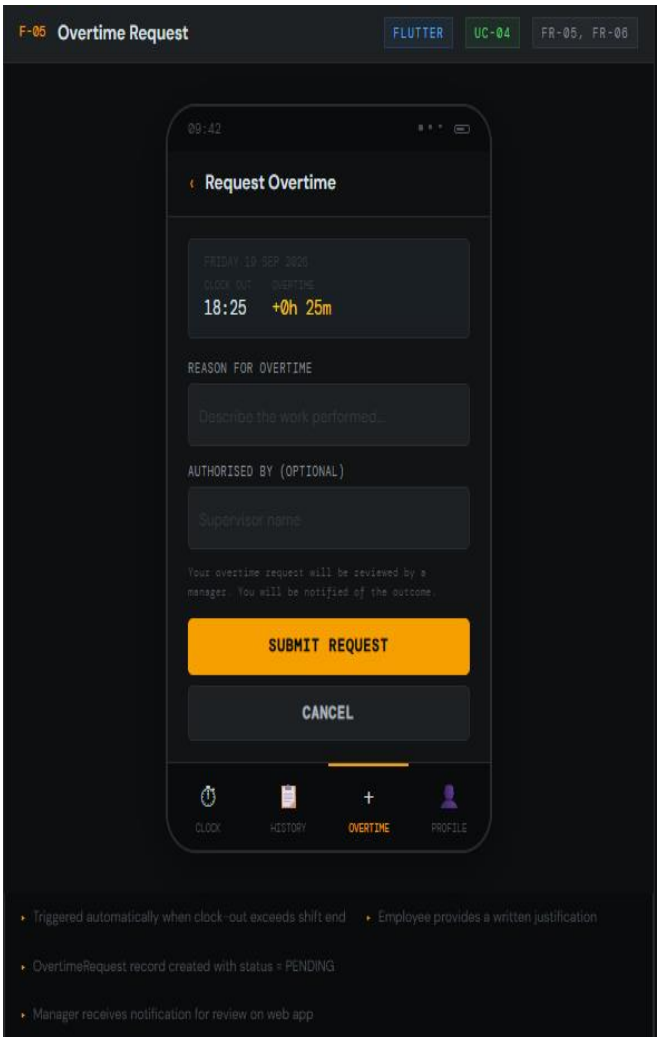

Employee clocks in and out and views current shift

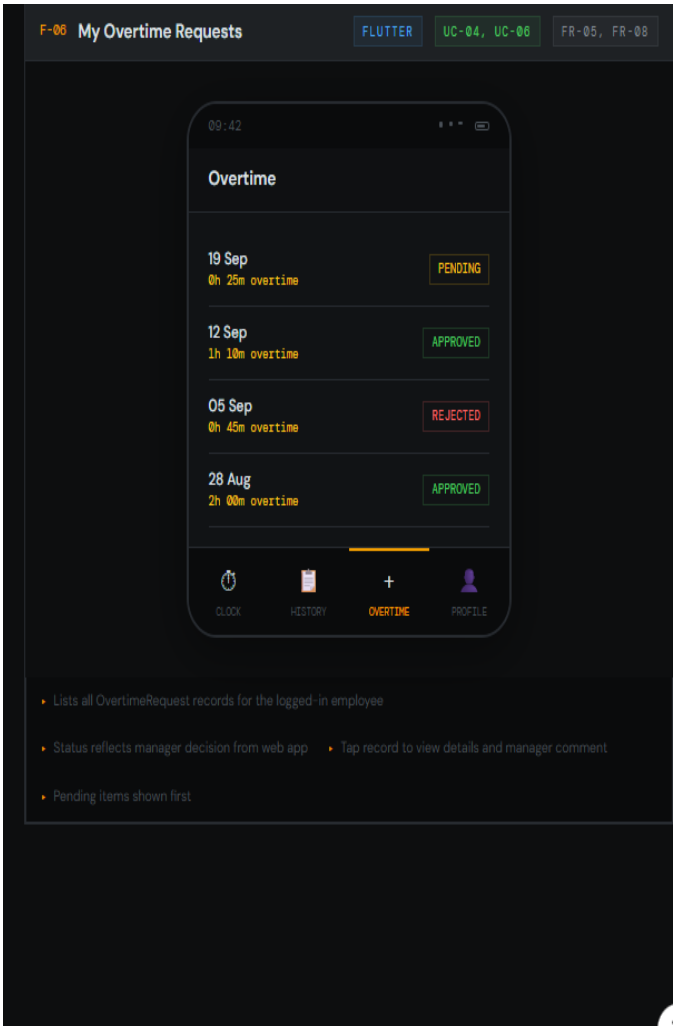

Employee can view their hours and also clock out for breaks

Employee views their past attendance records

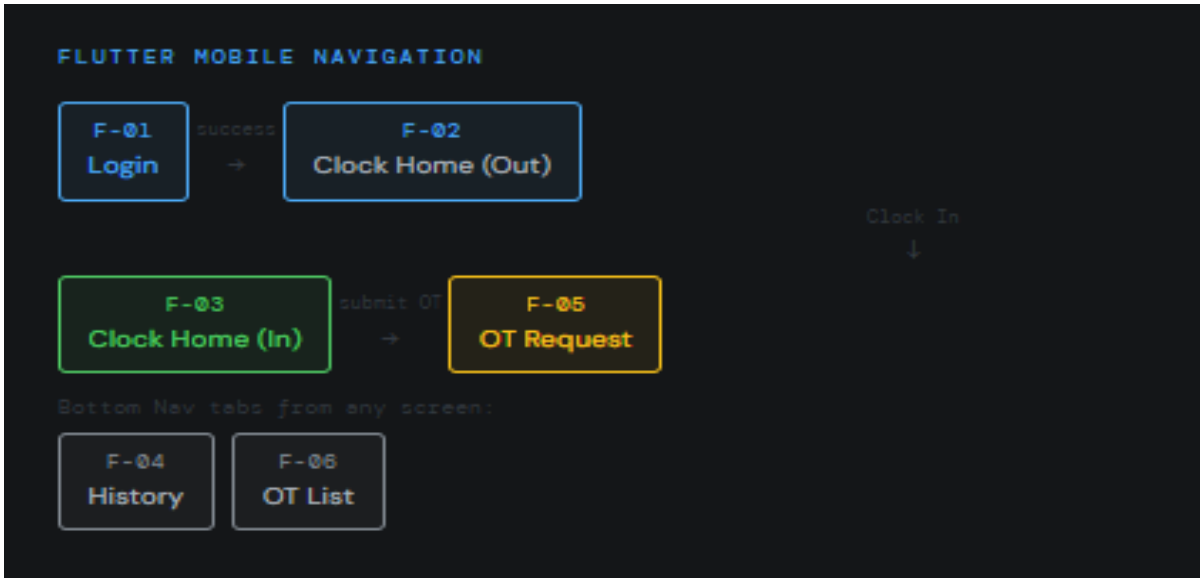

Employee submits an overtime request

Employee can see their overtime status

How users navigate between important flutter screens

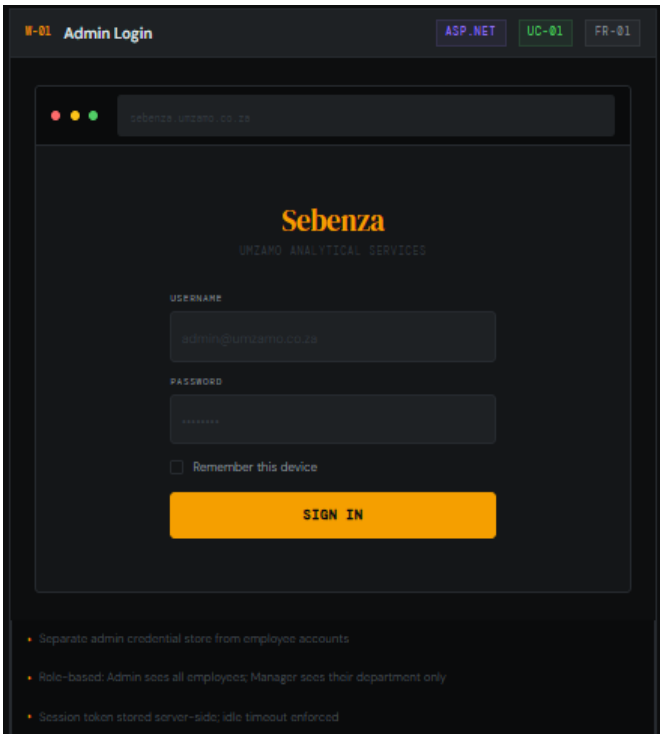

1. **F-01 Login** → Employee logs in
2. **F-02 Clock Home (Out)** → Lands on the clock screen (clocked out state)
3. **F-03 Clock Home (In)** → After clocking in, the same screen changes to clocked in state
4. **F-05 OT Request** → Employee submits an overtime request

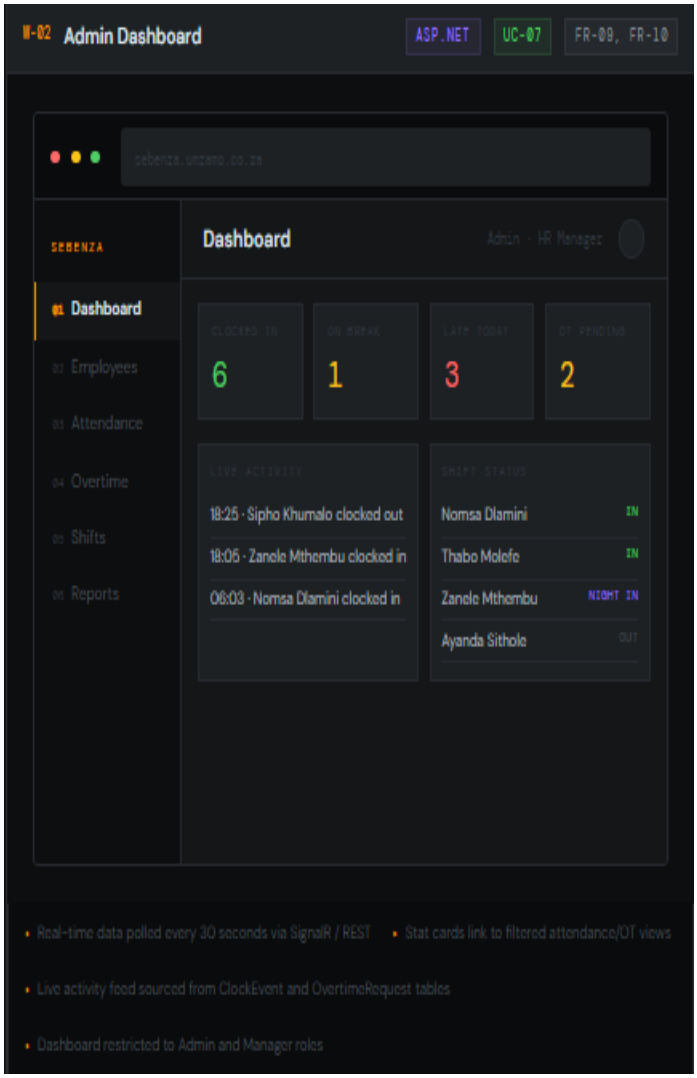

From **any screen**, the employee can tap these two tabs

- **F-04 History** — view attendance history
- **F-06 OT List** — view overtime list/status

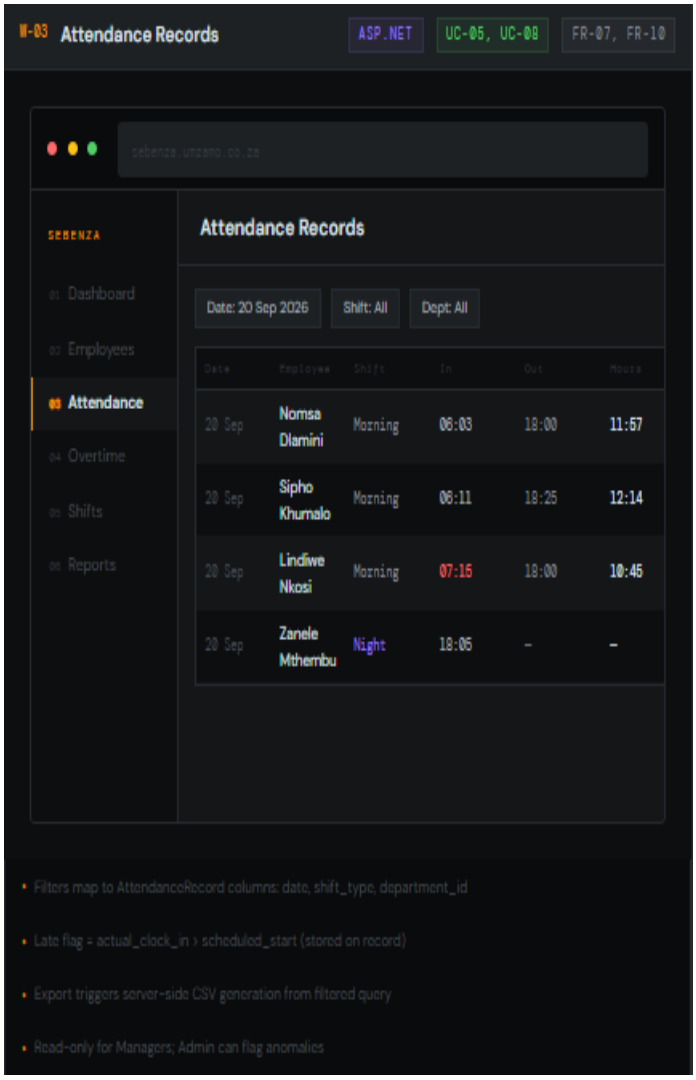

main ASP.NET web pages

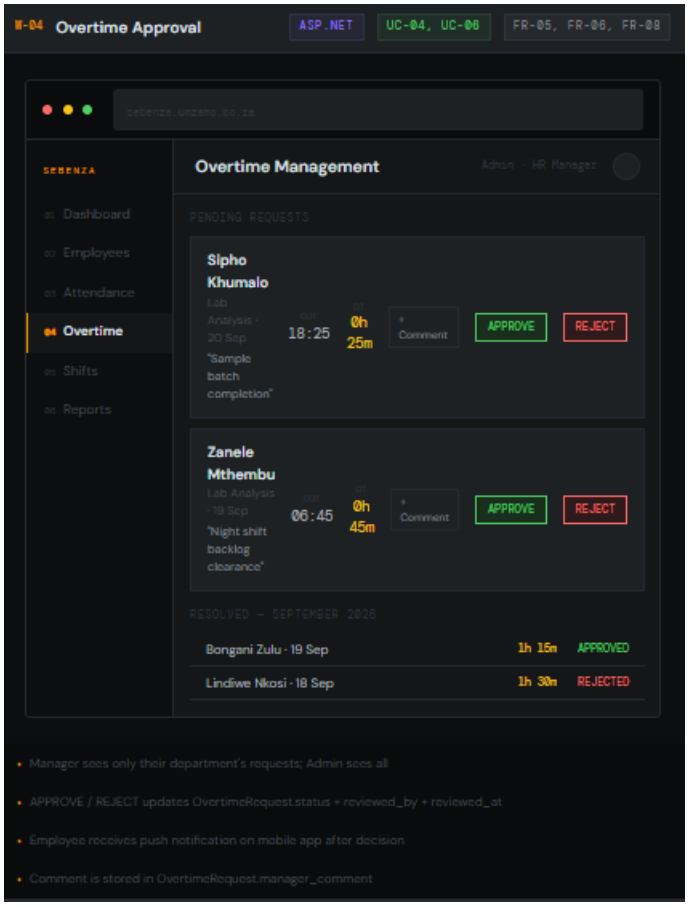

The Admin Login page allows authorised management users (supervisors, HR, and administrators) to sign in using a username and password

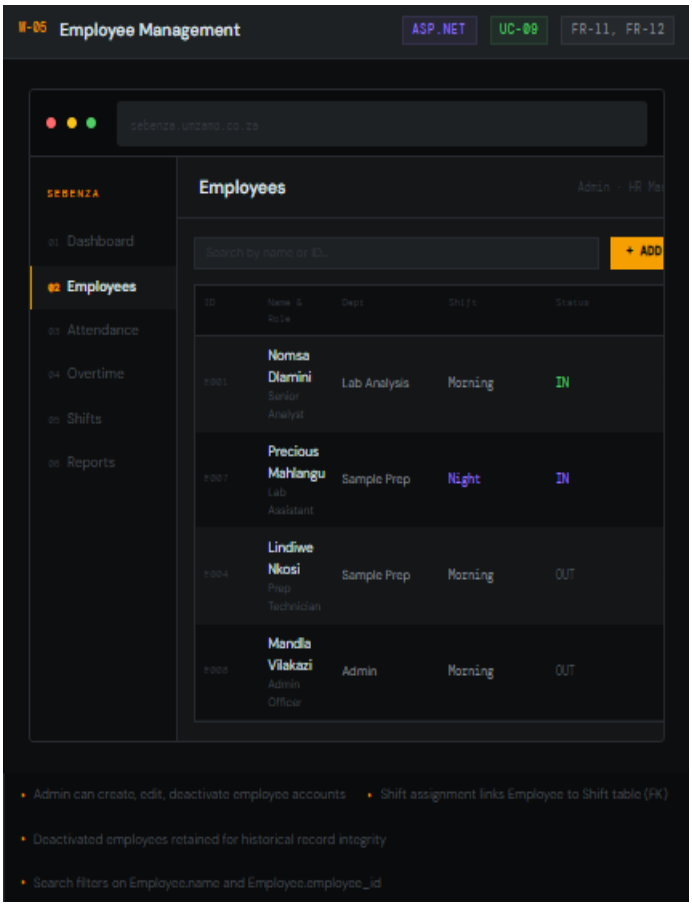

The Admin Dashboard is the landing page after login for supervisors, HR, and administrators. It provides a real-time overview of the workforce status and attendance activity.

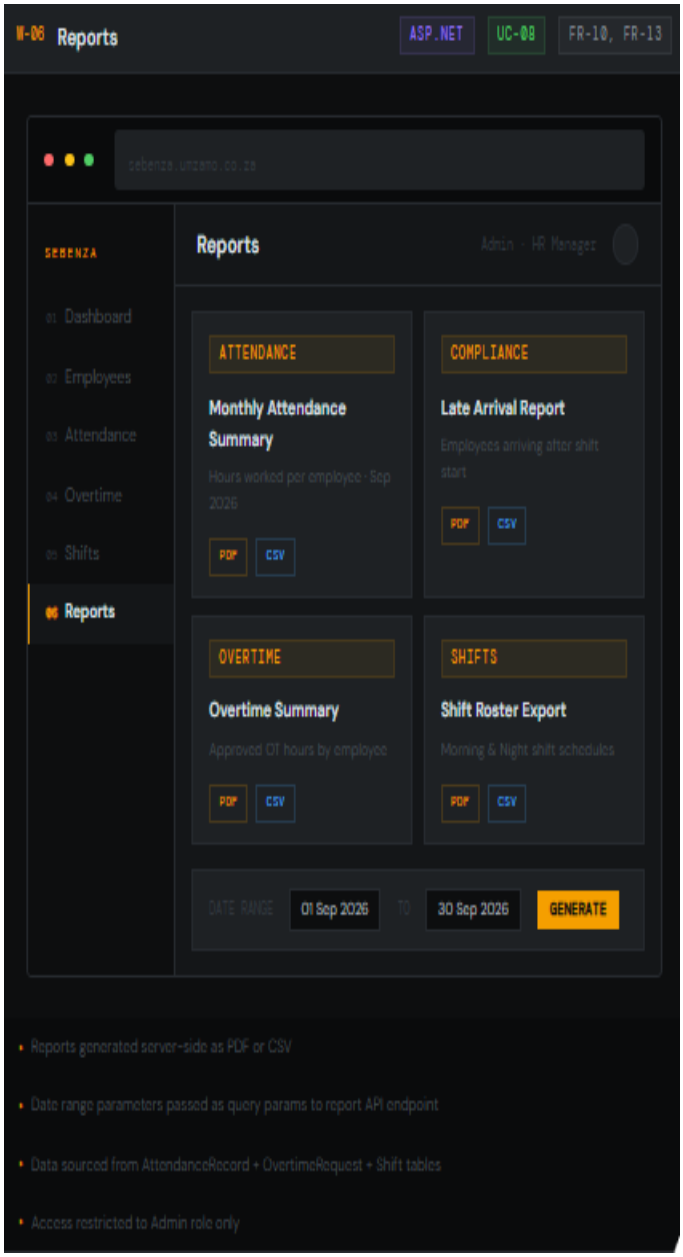

The Attendance Records page allows supervisors and administrators to view, filter, and export employee attendance records for a chosen date or period.

*The Overtime Approval page allows supervisors and management to review pending overtime requests. Each request shows the employee's name, the date, the overtime hours, and a comment where required. Supervisors can tap **APPROVE** or **REJECT** to make a decision. Approved and rejected requests are shown in a history section at the bottom of the page.*

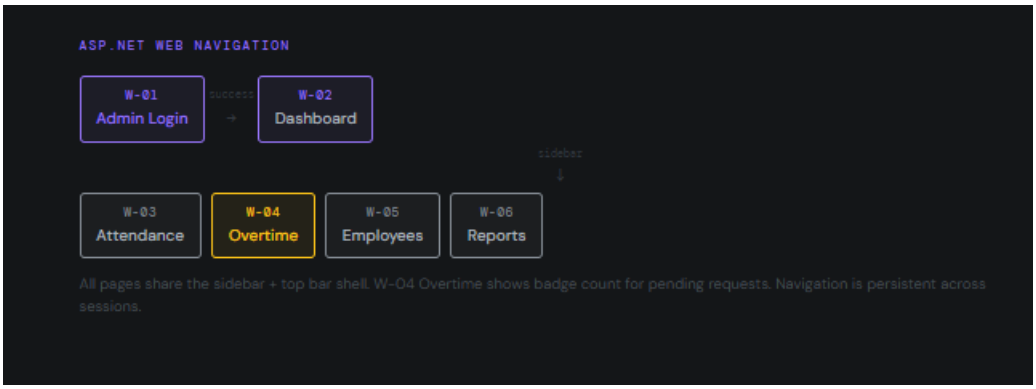

The Employee Management page allows administrators to view, add, update, and deactivate employee accounts. The page shows a table of employees with their names, departments, shifts, and current status (In / Out). A "+ ADD" button allows new employees to be created.

The Reports page allows authorised management users to generate and export attendance, overtime, compliance, and shift reports for a selected date range.

How users navigate between important ASP.NET screens

The ASP.NET web application uses a sidebar navigation layout. After logging in through the Admin Login page (W-01), the management user lands on the Dashboard (W-02). From the Dashboard, the sidebar provides access to Attendance (W-03), Overtime (W-04), Employees (W-05), and Reports (W-06). The Overtime page displays a badge count showing the number of pending overtime requests. All pages share the same sidebar and top bar, and navigation is persistent across sessions.

5 Design Alignment Across the designs

Requirement	Use Case	Sequence	ERD element	Flutter interface	ASP.NET interface
FR1 Login	Login	Both sequences validate authenticated sessions	Employees / Supabase Auth	Login	Login
FR2 Clock In	Clock In	Employee Clock-In	Attendance	Clock Home	-
FR3 Automatic clock-in time	Clock In	Employee Clock-In	Attendance.clock_in	Clock Home	-
FR4 Clock Out	Clock Out	-	Attendance	Clock Home	-
FR5 Automatic clock-out time	Clock Out	-	Attendance.clock_out	Clock Home	-
FR6 Attendance history	View Attendance History	-	Attendance	History	Attendance Records
FR7 Working hours	View Working Hours	-	Attendance.total_hours	Working Hours	Reports / Attendance
FR8 Monitor attendance	Monitor Attendance	-	Attendance + Employees	-	Attendance Records / Dashboard
FR9 Overtime	Submit / Review Overtime	Overtime Review	Overtime	Overtime Request / Status	Overtime Approval
FR10 Employee management	Manage Employee Information	-	Employees + Departments	-	Employee Management

Requirement	Use Case	Sequence	ERD element	Flutter interface	ASP.NET interface
FR11 Attendance correction	Request Attendance Correction	-	Attendance_Corrections	Correction Request (Flutter)	Attendance Records
FR12 Reports	Generate Reports	-	Attendance + Overtime + Employees	-	Reports
FR13 Audit Logging	Monitor Attendace	-	Audit_Log	-	Attendance Records
FR14 Break recording	Clock in / Clock Out	-	Attendance.break_minutes	Clock Home	-
